

Cushion Tire Forklift Part

Cushion Tire Forklift Parts - Cushion tires have a smooth profile on a solid tire with its tread being bonded to a steel ring so as to form the tire. The tire is pressed on the hub which is then affixed onto the lift truck. These kinds of tires are perfect to use in smooth floor warehouses and are obtainable in several polyurethane or rubber compounds.

A poly tire has polyurethane as a substitute for rubber and is also a solid tire. They are utilized rather than cushion tires for such applications which require a lower steering effort or a higher tire load capacity than can be acquired making use of the cushion tire. Poly tires are in several hardness ratings so as to meet other individual application needs. Narrow Aisle models and Orderpicker lift trucks will normally use small diameter poly tires for their outrigger load wheels.
