

Order Picker Attachment

Order Picker Attachments - Order picking is also called order preparation operation. This is one of the chief processes in a warehouse and consists of people known as order pickers, collecting and taking articles in a particular quantity previous to shipment so as to complete client orders. Order picking is an easy warehousing method. The effectiveness in which this job is completed could be directly related to a supply chain's productivity. Thus, order picking is amongst the most controlled logistic processes. Order picking falls within the category of the warehouse management system.

There are some certain types of order picking. The main types comprise: wave picking method, pick to box method, piece picking or picker to part method, zone picking method and sorting systems method.

The pick to box method involves the order picker only filling the boxes with things which are from their specific station. The box then moves on to other stations until the order is finish. In this particular process, there is no movement of the order picker staff. In the wave picking method, the order pickers move around in order to gather the required products for some orders. The picker to part method or piece picking is similar where the order picker or pickers move to collect the stuff required but for one order only.

In the sorting systems method, there is no movement of the order picking personnel. Instead, the things are brought to him or her via an automated system like for example a conveyor system or an automatic storage. In the zone picking method, every order picker is assigned to one particular zone. They are responsible for only realizing order picking within this specified zone.
