

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that can allow the individual driving to be able to control the lift truck without leaving the seat. They are made out of top quality materials and are intended to be able to endure the most demanding operations and work environments. Side shifting models have the added ability to laterally position the entire load or the arms in order to facilitate more accurate lifting and placement in a faster and more efficient manner.

The blade pocket is somewhat unique and could enable the person operating it to safely swing the forks into position without any worry of destroying the positioning cylinders. This allows the driver the option to perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on available units.
